I had created a application with base MVC TEMPLATE.

For running the application .

1. Open the solution file in visual studio
2. Update the appsettings.json file with db connection to your local mssql server
3. Follow the below steps to run migration.
   a. Open tools— Nuget Package   Manager—Package manager console
  b . Run the below commands in that console
    dotnet ef migrations add InitialCreate
    dotnet ef database update

Then run the project in visual studio.

Thanks
